

Project title: Clicking Cookies

Group number: 14

List of team members: Kevin Vu, Berkley Hughes, Forrest Wilkerson, Emma Broggi

Proposed Project Description

---

#### Problem:

- In a world with many virtual outlets that display food and recipes. It can be a hassle going through food articles, YouTube-recommended recipe videos, and quick snack-making videos on TikTok. Our project looks to conglomerate all those recipes and make them easier to share among everybody.
- Everyone wants to eat good food, but only some are professional chefs who can create their recipes, and eating the same few meals can become boring.

#### Software Used:

- Our team plans to create a Mobile Application using Android Studio and coding within Java, or a Web application using HTML and Java Base.

#### How it Will Be Addressed:

- Our project provides a system where users can add their recipes and find other recipes that interest them.
- Share recipes with others
- Accessible display of recipe information and instructions
- Ability to save recipes they like for later use.

#### Stakeholders:

Our stakeholders can vary greatly as food is a necessity for all, and we look to allow everyone to be able to use the project. However, being a virtual experience, we do aim specifically toward the youth and students who may have problems with time or dietary restrictions finding quality and/or quick recipes to cook.

- The main project stakeholders will be the professors and TAs (project-specific)
- Students with dietary restrictions
- Students with tight schedules who need quick access to quick recipes
- Students with financial weariness
- Ordinary Consumers: would be able to find or upload recipes they like.
- Professional/Amateur Chefs: They could post their recipes online at a central location for some advertising.
