

Group 15: Berkley Hughes & Emma Broggi

Problems Being Addressed

- Compiling statistics on commonly measured state metrics can take hours of work and many separate web pages
- Current websites offering state data on important metrics are often either split by state or by metric, meaning users will have to bounce around from site to site to see all the data they are interested in

How it will be Addressed

Our project, InfoVis, will provide a way for users to have access to the most important metrics about US states in one central location.

- Users will be able to access data such as violent crime, property crime and cost of living
- Users can sort this data by state, year, etc. to see the data in a way that is most relevant to their goals
- Users will be able to see this data represented visually as well as numerically

Software Used

Stakeholders Involved

The main project stakeholders will be the professor and TA, but this project has a wide variety of applications that could be used by many different people

- Individuals looking to emigrate/immigrate, purchase property, or visit a specific state or group of states
- Students seeking data for essays or projects that might have difficulty compiling it from a variety of sources
